🎓 Successfully Completed: Web Application Basics – TryHackMe

I recently completed the Web Application Basics room on TryHackMe, which provided a structured introduction to how modern web applications function behind the scenes. This learning module enhanced my understanding of essential concepts such as HTTP communication, request/response structures, status codes, web servers, and core security considerations.

Strengthening these fundamentals is crucial for anyone working in cybersecurity, as they form the foundation for web application testing and secure development practices.

I look forward to building upon this knowledge through more advanced modules.

You did it! 🎉 Web Application Basics complete!
